

Write an app to store employee details in a core data table. There will be three screens in the app:

1. First screen is to enter employeeID, first name, last name and employee picture. This screen has an “add” button, a “browse” button and a “view all employees” button. Add button adds the employee to the core data table.
2. When the “view all employees” button is clicked show all the contents of the core data table. This screen has a back button to go back to first screen.
3. When the browse button on the first screen is clicked, show a screen which displays one employee details including the picture. Show four buttons on this screen “previous, next and delete”. On press of “previous”, previous employee detail will be shown and on “next” next employee details will be shown. Delete will delete the employee. This screen also has a back button to go back to first screen.
